

Any tall objects can block signal from reaching the antenna!

OPERATING NOTES:

The antenna unit begins scanning when you connect the power injector to the receiver. **PLEASE BE PATIENT!** The antenna unit may lock on the satellite in as little as 2 minutes, but may occasionally take up to 10-15 minutes.

If you wish to start a new scan (for example, you move the vehicle and lose reception): press the power injector's RESET button. This is the preferred method to start a new scan, but there are two alternate methods as well:

- Disconnect and reconnect the coax from the antenna unit to the power injector.
- Press the RESET button on the receiver (works for select receivers only, such as models D12, H24, and HR24).

The KING Quest will not lock on the 119 satellite, so you will not receive your local channels if they are broadcast from the 119. If you wish to receive programming from the 119 as well as the 101, you can replace the power injector with the KING UC1000 Controller (sold separately - see your dealer or our website www.kingconnect.com for details.)
